

## Latest Addition to LifeTrac - BiologicTx®

LifeTrac is pleased to announce the addition of BiologicTx® to its provider network. BiologicTx was founded as the first solely-focused infusion and pharmacy provider of biologic and oral transplant therapy management. BiologicTx's services and its dedicated professionals – who strive to advance desensitization, immunosuppressive and rejection treatments in order to provide more favorable patient outcomes – are now available to LifeTrac clients nation-wide. LifeTrac clients are now able to access a comprehensive stream of information and clinical services through BiologicTx as it works in concert with transplant center medical teams.

BiologicTx's unparalleled expertise and experience in the provision of desensitization therapies can be accessed directly through LifeTrac. This therapy is provided pre-transplant to patients who are highly sensitized to human leukocyte antigen (HLA) by administering intravenous immunoglobulin (IVIG) and other biologicals that statistically increase the chances of successfully transplanting previously "un-transplantable" patients. Desensitization is not a new treatment modality. It has been successfully utilized by transplant centers around the U. S. since the NIH-sponsored IGO2 clinical trial began in 2000.

Desensitization therapy is a viable option for patients that are highly sensitized and should be considered to be a safe, first-line treatment modality that can lead to successful transplantation. Given that ongoing dialysis (at a cost of approximately \$40K-\$50K/month) is an expensive alternative to kidney transplantation; desensitization therapy has the potential to result in a significant savings to payers.

LifeTrac is also able to provide a variety of medications and related support services for the treatment and management of Hepatitis C, hemophilia and other complex medical conditions through its partnership with BiologicTx. Please contact LifeTrac at 800-968-8722 for additional information regarding BiologicTx or its services.
